CRUD OPERATION

Create.php (file to insert into the database)

```
<?php
// enable php to use json
header("Content-type: application/json");
// incude connection
include "connection.php";

// read json data from client and convert to php array
$data=json_decode(file_get_contents("php://input"),true);

// data to insert into the database
$name=$data["name"];
$value=$data["value"];
$status=$data["status"];

// query to insert
$sql="INSERT INTO
sensor_data(name,value,status)VALUES('$name','$value','$status')"
;
// execute query
if (mysqli_query($conn, $sql)){
    echo json_encode([
        "status"=>"success",
```

```

        "message"=>"device inserted@"

    });

}else{
    echo json_encode([
        "status"=>"error",
        "message"=>"failed"
    ]);
}

```

read.php (file to read from the database)

```

<?php
// enable php to use json
header("Content-type: application/json");

// incude connection
include "connection.php";
// query to select from database
$sql = "SELECT * FROM sensor_data";
// execute query
$result = mysqli_query($conn,$sql);
// create empty array to store devices
$devices = [];
// fetch data
while($row = mysqli_fetch_assoc($result)){
    $devices[] = $row;
}
echo json_encode([
    "status"=>"Success",

```

```
        "data"=>$devices
    ]);
```

update.php (updating data)

```
<?php
// enable php to use json
header("Content-type: application/json");
// include connection
include "connection.php";
// read json data from client and convert to php array
$data = json_decode(file_get_contents("php://input"),true);

// prepare data to update
$id = $data["id"];
$name = $data["name"];
$value = $data["value"];
$status = $data["status"];

// query to update data
$sql = "UPDATE sensor_data SET name='$name', value='$value',
status='$status' WHERE id=$id";
// execute query
if(mysqli_query($conn,$sql)){
    echo json_encode([
        "status"=>"success",
        "message"=>"device updated"
    ]);
}else{
    echo json_encode([
        "status"=>"Error",
```

```
        "message"=>"failed to update device"
    ]);
}
```

delete.php(delete data from the database)

```
<?php
// enable php to use json
header("Content-type: application/json");
// include connection
include "connection.php";
// read json data from client and convert to php array
$data=json_decode(file_get_contents("php://input"),true);

// get id to delete on
$id=$data["id"];
// query to delete
$sql="DELETE FROM sensor_data WHERE id=$id";
// execute query
if(mysqli_query($conn,$sql)){
    echo json_encode([
        "status"=>"success",
        "message"=>"device deleted"
    ]);
}
else{
    echo json_encode([
        "status"=>"error",
        "message"=>"device not found"
    ]);
}
```
